

Unifolio — Project Overview (Start Here)

Welcome aboard. This document is your first read — it explains what we're building and why, before you get into the detailed documents. Read this in full before opening anything else in the Drive folder.

What Unifolio Is

Unifolio is a wealth management and portfolio tracking platform for the Indian market — built to be a genuinely better alternative to the category leader, Mprofit. It tracks a user's mutual fund (and eventually broader) investments, gives them clear analytics on what they actually own, and does it with an experience that doesn't feel like a legacy finance tool.

The Problem We're Solving

Every existing portfolio tracker in this market makes you choose between two bad options: a free tool that's clunky and shallow, or a proper analytical tool that's locked behind a paid advisory relationship. Nobody offers genuinely free, deep tracking *plus* the kind of cost transparency (what you're actually paying in fees, commissions, and distributor cuts) that a serious investor needs. That gap — free + deep + honest about cost — is what Unifolio is built to occupy.

Who It's For

Two kinds of users, in one product: retail DIY investors managing their own money, and HNI (high-net-worth) investors who often invest partly through an advisor or distributor but still want to see and understand everything themselves. The product has to feel right to both — this shows up repeatedly in the design decisions you'll read about in the PRDs (Product Requirement Documents).

What's Been Built So Far

- A working backend pipeline that parses a user's CAS (Consolidated Account Statement — the official PDF record of all their mutual fund holdings, issued by CAMS or KFintech) into structured data: holdings, transactions, gains, XIRR. Scaffold, calculations, data models, NAV enrichment, and the core API are done. What's left is tightening it and building the frontend around it — this is your Week 1 focus.
- A full set of PRDs (detailed requirement documents — more below) for the four core modules of the MVP.
- A locked brand identity and a Design Brief setting the visual direction.
- Extensive competitor research — 11 competitors profiled in depth.

What You're Building Toward (MVP Scope)

Four modules make up this MVP:

1. **CAS Parser v2 (MF Import)** — the module that gets a user's real portfolio data into the app. Already has a working backend; needs tightening plus a couple of new capabilities (see PRD-01).
2. **Signup & Onboarding** — a questionnaire-based flow (not a boring signup form) that sets up a user's account, household, and gets them to their first imported portfolio fast. Nothing built yet — this is a from-scratch build (see PRD-02).
3. **Main Dashboard** — the home screen showing everything a user owns.
4. **MF Analytics Dashboard** — deeper analysis: how funds compare to their category and to market benchmarks, what they cost, how they score.

You'll be reading PRDs for all four, but hands-on building this week is focused on modules 1 and 2.

Why This Matters

The regulatory landscape actually favors this approach right now: the old bulk API that most competitors relied on for MF data was shut down industry-wide in September 2025. CAS-PDF parsing — which is what's already built here — is now the standard approach across the industry, not a workaround. Getting this module genuinely solid is a real competitive position, not busywork.

Who to Ask

If anything is unclear after you've gone through the reading material, Ayush is away this week — reach out to **Siddharth Surve** (co-founder, based in the office) for anything that blocks you. Don't sit stuck on something for more than half a day without asking.
